Course code: ITA1407

Course: Ethical Hacking

1. A Fellow Ethical hacker on your Team wants to keep a "personal copy" of Exploit code and access credentials discovered during a client engagement "in case it's useful later". Analyze the ethical and professional violations in this scenario. I want to write and analyze violations.

Ethical And professional violations in the scenario

In this scenario, an ethical hacker wants to keep a personal copy of exploit code and access credentials found during a client's security assessment. This is unethical and unprofessional for the following reasons.

1. Violation of client confidentiality

* The Exploit code and Access credentials belong to the client.

* Keeping personal copies without permission breaks the client's Trust.

2. Authorized possession of sensitive data.

- * Access credentials and exploit code are confidential information.

- * Storing them for personal use is not allowed and increases the risk of misuse.

3. Misuse of professional Responsibility

- * Ethical hackers must use collected information only for the agreed security assessment.

- * Keeping the data "for future use" goes beyond the authorized purpose.

4. Risk of security Breaches

- * If the personal copy is lost, hacked or leaked, Attackers could use it to compromise the clients systems.

- * This can cause financial loss and damage to the clients reputation

- * Attackers could use it to the compromising clients systems.

5. Violation of Ethical Standards

- * professional ethical hackers follow a code of ethics, respect privacy, and protect confidential information
- * keeping sensitive data without approval violates these professional standards.

6. possible legal consequences

- * Unauthorized retention of exploit code and credentials may violates contracts, company policies, or cybersecurity laws.
- * The Ethical Hacker could face disciplinary action, legal penalties, or loss of the professional reputation.

Real life Impact

If the exploit code or credentials are leaked, attackers could gain unauthorized access to the clients systems, leading to data theft, financial

to the clients reputation - The Ethical
Hacker would also lose their jobs,
face legal action and lose professional
credibility.

Conclusion

An Ethical Hacker should never keep
personal copies of exploit code or
Access credentials after a client
Engagement. All sensitive information
should be securely handled, returned
or destroyed according to the clients
agreement and organizational policies,
maintaining confidentiality for building
Trust and protecting the clients security.
